Sol. Average velocity = $\frac{\text{Total displacement}}{\text{Total time}}$

$$\text{Total time taken} = t_1 + t_2 + t_3 + \dots$$

$$= t_1 + \frac{t_1}{\alpha} + \frac{t_1}{\alpha^2} + \dots$$

$$\Rightarrow \frac{u^2}{4g} = 120 \quad \dots(i)$$

7. **Ans. (C)**

Sol. Density of sphere is $\rho = \frac{m}{v} = \frac{3m}{4\pi R^3}$

$$\Rightarrow \frac{1}{\rho} \frac{d\rho}{dt} = -\frac{3}{R} \frac{dR}{dt}$$

Since $\Rightarrow \frac{1}{\rho} \frac{d\rho}{dt}$ is constant

$$\therefore \frac{dR}{dt} \propto R$$

Velocity of any point on the circumference V is equal to $\frac{dR}{dt}$ (rate of change of radius of outer layer).

8. **Ans. (2 or 8)**

Sol. Assuming open chamber

$$V_{\text{relative}} = 0.5 \text{ m/s}$$

$$S_{\text{relative}} = 4\text{m}$$

$$\text{time} = \frac{4}{0.5} = 8 \text{ m/s}$$

Alternate

Assuming closed chamber

In the frame of chamber :

Maximum displacement of ball A from its left end is $\frac{u_A^2}{2a} = \frac{(0.3)^2}{2(2)} = 0.0225 \text{ m}$

This is negligible with respect to the length of chamber i.e. 4m. So, the collision will be very close to the left end.

Hence, time taken by ball B to reach left end will be given by

$$S = u_B t + \frac{1}{2} a t^2$$

$$4 = (0.2)(t) + \frac{1}{2}(2)(t)^2$$

Solving this, we get

$$t \approx 2 \text{ s}$$

9. **Ans. (5)**

Sol.

As observed from A, B moves perpendicular to line of motion of A. It means velocity of B along A is equal to velocity of A

$$V_B \cos 30 = 100\sqrt{3}$$

$$V_B = 200$$

If A is observer A remains stationary therefore

$$t = \frac{500}{V_B \sin 30} = \frac{500}{100} = 5$$
