## HYPERBOLA

**1.** Consider the hyperbola

$$\frac{x^2}{100} - \frac{y^2}{64} = 1$$

with foci at S and S<sub>1</sub>, where S lies on the positive x-axis. Let P be a point on the hyperbola, in the first quadrant. Let  $\angle$ SPS<sub>1</sub> =  $\alpha$ , with  $\alpha < \frac{\pi}{2}$ . The straight line passing through the point S and having the same slope as that of the tangent at P to the hyperbola, intersects the straight line S<sub>1</sub>P at P<sub>1</sub>. Let  $\delta$  be the distance of P from the straight line SP<sub>1</sub>, and  $\beta = S_1P$ . Then the greatest integer less than or equal to  $\frac{\beta\delta}{9}\sin\frac{\alpha}{2}$  is \_\_\_\_\_. [JEE(Advanced) 2022]

2. Let a and b be positive real numbers such that a > 1 and b < a. Let P be a point in the first quadrant that lies on the hyperbola  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ . Suppose the tangent to the hyperbola at P passes through the point (1,0), and suppose the normal to the hyperbola at P cuts off equal intercepts on the coordinate axes. Let  $\Delta$ denote the area of the triangle formed by the tangent at P, the normal at P and the x-axis. If e denotes the eccentricity of the hyperbola, then which of the following statements is/are TRUE ?

(A) 
$$1 < e < \sqrt{2}$$
 (B)  $\sqrt{2} < e < 2$  (C)  $\Delta = a^4$  (D)  $\Delta = b^4$ 

3. Let H :  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ , where a > b > 0, be a hyperbola in the xy-plane whose conjugate axis LM subtends

an angle of 60° at one of its vertices N. Let the area of the triangle LMN be  $4\sqrt{3}$ .
