3.0: Introduction:

Q.1. Define:

- i. Cell
- ii. Cellular pool
- Ans: i. Cell: It is a fundamental, structural and functional unit of an organism.
 - ii. Cellular pool: The collection of various types of molecules in a cell is known as cellular pool.

Q.2. Write a short note on cellular pool

Ans: Cellular pool:

- i. There are different types of materials present in the cell which make it possible to carry on all metabolic activities. This collection of various types of molecules in a cell is known as cellular pool.
- ii. It consists of inorganic material and organic compounds.
- iii. Inorganic material includes water, salts and mineral ions; while organic compounds are carbohydrates, proteins, inputs, nucleic acids, etc.
- iv. All the polecules in a cellular pool help in metabolic activities of the cell.

Q.3. Define metabolism. Explain the parts of metabolism .

Ans: i., Metabolism means various reactions that occur at cellular level in every living organism.

- Metabolism consists of two parts, i.e. catabolism and anabolism.
- **3**. In anabolism, new cellular materials are synthesized.
- iv. In catabolism, complex storage products are hydrolyzed and simpler, smaller products are formed.
- v. Both anabolic and catabolic reactions require enzymes.

Q.4. What are macromolecules? Give examples.

- **Ans:** i. Macromolecules are large sized compounds with high molecular weight but poorly soluble in water.
 - ii. Examples: Proteins, polysaccharides, nucleic acids, etc.

Q.5. Name two different kinds of metabolism.

Ans: Anabolism and Catabolism are the two different kinds of metabolism.

3.1 : Basic chemical constitunets of cell :

Q.6. What are carbohydrates? Give the classification of carbohydrates.

Ans: Carbohydrates:

Carbohydrates are organic compounds containing carbon, hydrogen and oxygen. Plants are the major source of carbohydrates as they produce carbohydrates during photosynthesis. The general formula of simple carbohydrates is $C_nH_{2n}O_n$ and complex carbohydrates is $(C_6H_{10}O_5)_n$ Some carbohydrates like rhamnose and digitoxose do not follow general formula of carbohydrates. Simple carbohydrates are commonly known as sugars which are involved in metabolic reactions, whereas complex carbohydrates form structural units.

Classification:

Based on their structure, carbohydrates are classified as follows:

General formula of polysaccharide is (C6HIO05)n. Here, 'n' represents number of monosaccharide

They are classified into two types :

- Homopolysaccharides or homoglycans: It contains same type of monosaccharides. Example: Starch, cellulose, glycogen, pectin, agar.
- ii. Heteropolysaccharides or heteroglycans: They consist of different types of sugar or sometimes non-sugar components also. Example: Hemicellulose, mucilage, heparin.

Additional information :

Some important disaccharides are :

Disaccharides: e.g., Maltose, Sucrose, Lactose, etc.

Maltose is formed by condensation of the glucose monomers. It is commonly known as malt sugar.

Sucrose is formed by condensation of one glucose monomer and one fructose monomer. It is commonly known as cane sugar.

Lactose is formed by condensation of one glucose and 'one galactose monomer. It is commonly known as milk sugar.

Q.8. What is the general formula of carbohydrates?

Ans: $C_n H_{2n} O_n$ is the general formula of carbohydrates.

Q.9. What is the main role of carbohydrates?

Ans: Main role of carbohydrates 'is to provide energy to the body for metabolism.

Q.10.Give the role of carbohydrates.

OR

What ole does carbohydrates play in living body?

Ans: Role of carbohydrates:

- The most important function of carbohydrates is to provide energy to the body for metabolism. Glucose supplies the immediate energy to the body. One, gram of carbohydrate on oxidation yields on an average four calories. In plants, starch is the reserved food, while in man glycogen is the reserved food.
- ii. Monosaccharides like glucose is the main substrate for synthesis of ATP.
- iii. Carbohydrates are the structural components of cell membrane and cell wall.
- iv. Cell wall of plants consists of cellulose and pectin.

Q.11. Distinguish between monosaccharides and disaccharides.

Ans:

No.	Monosaccharides	Disaccharides
i.	They are composed of 3-6 carbon atoms.	They are composed of two monosaccharide units covalently linked to each other.
ii.	They cannot be hydrolyzed into smaller units.	They can be hydrolysed into monosaccharides.
iii.	Example: Glucose, Fructose	Example: Sucrose and Lactose

Q.12. Differentiate between Disaccharides and Polysaccharides. Ans:

No.	Disaccharides	Polysaccharides
i.	Made up of 2 monosaccharide units.	Made up of many monosaccharide units.
ii.	Soluble in water	Not soluble in water.
iii.	Sweet in taste.	Tasteless.
iv.	e.g. Sucrose, maltose, lactose.	e.g. Glycogen, starch and cellulose.
v.	They are crystalline.	They are amorphous.

Q.13. What are the three groups of carbohydrates?

Ans: The three groups of carbohydrates are:

i. Monosaccharides ii. Disaccharides

Q.14. Who coined the term 'protein'?

Ans: Berzelius (1830) coined the term 'protein'.

Q.15. Write a note on the. properties of proteins.

Ans: Properties of proteins:

i. Proteins are long chain polymers of amino acid and contain carbon, hydrogen, oxygen and nitrogen.

iii.

Biochemistry of Cell

- ii. Proteins are large macromolecules with high molecular weight and most abundant organic components of the cell.
- iii. Proteins are important structural constituents of the cell.
- iv. Many proteins are host specific anothew slight variation in each species.
- v. The differences among the species are due to differences in the protein components.
- vi. The number of proteins in a certraries.
- vii. Some protein molecules contain sulphur and other elements in addition to C, H, O and N.

Q.16. Explain about the formation of a protein molecule.

OR

How does the formation of a protein molecule take place?

- Ans: i. The basic building blocks of proteins are amino acids.
 - ii. In a long chain' of amino acids forming a protein, the amino group $(-NH_2)$ of one amino acid is linked to the carboxyl (-COOH) group of the other amino acid.
 - iii. Two amino acids are condensed by removal of a water molecule (OH from COOH and H from NH_2) to form a peptide linkage.

v. The remainder of each amino acid after removal of water molecule (Wand OH-) is called residue.

- A molecule of a protein made up of two amino acid residues is called a dipeptide, of three residues are tripeptide and of many residues as polypeptide.
- vi. Each polypeptide, i.e. a long chain of amino acids contain free amino group (-NH2) at one end and carboxyl (-COOH) group at the other end called N-terminal and C-terminal respectively.
- vii. During elongation of polypeptide chain, a new amino acid can be added at either end due to free amino or carboxyl group.

Q.17. Name the different amino acids that occur in the cell.

Ans: The different amino acids occuring in the cell are as follows:

i.	Glycine	ii.	Alanine iii. Serine		Serine	iv.	Cysteine
v.	Aspartic acid	vi.	Glutamic acid	vii.	Asparagine	viii.	Glutamine
ix.	Methionine	X.	Threonine	xi.	Valine	xii.	Leucine
xiii.	Isoleucine	xiv.	Lysine	XV.	Histidine	xvi.	Arginine
xvii.	Phenylalanine		xviii. Tyrosine		xix. Tryptoph	an	xx. Proline

Q.18. How amino acids are linked to form a long chain?

Ans: In a long chain of amino acids, the amino group (-NH₂) of one amino acid is linked by peptide linkage to the carboxyl group (-COOH) of the other amino acid.

Q.19. Give the classification of proteins.

Ans: Proteins are classified into two main types depending upon the chemical composition:

- i. Simple proteins ii. Conjugated proteins
- i. Simple proteins: They are made up of amino acids or their derivatives. There are different groups included in simple proteins.

e.g. Albumin, globulin, histones, zein from maize.

ii Conjugated proteins: They consist of simple proteins (amino acids) in combination with some nonprotein component. The non-protein part is called prosthetic group.

Polysaccharides

- a. Lipoproteins (Proteins + Lipids), e.g. egg yolk, serum
- b. Nucleoproteins (Protein + Nucleic acid).
- c. Glycoproteins (Proteins + Carbohydrates), e.g. mucin of the saliva.
- d. Chromoproteins (Proteins + Pigment) e.g. Cytochrome, haemoglobin

Q.20. What are proteins? Describe different biological functions of proteins.

Ans: Proteins:

Proteins are the long chain polymers of amino acids and possess high molecular weight. They contain C, H, O and N. The presence of N distinguishes them from carbohydrates and lipids. Some proteins contain sulphur, while few proteins contain phosphorus also. Cells contain a large number of proteins.

Biological functions of proteins:

The biological importance of proteins is as johows:

- i. Membrane proteins: Cell membrane consists of proteins and lipids. All membrane bound cell organelles have lipids and proteins in their membranes.
- **ii. Enzymes:** All enzymes are proteins. Enzymes may contain some other non-protein part also along with protein. e.g. Amylase.
- **iii. Hormones:** Hormones are proteins. They play an important role in the regulation of metabolic reactions in the body. e.g. Insuin, thyroxine.
- **iv. Transport protein:** Haemoglobin which is present in R.B.C. of man is a type of protein. It is useful for transportation of oxygen.
- v. Contractile protein: Muscle fibres consist of proteins, which help in contraction. e.g. Myosin.
- vi. Structural protein: These proteins form parts of cells or tissues. e.g. Keratin is present in hair and skin, while elastin is present in connective tissue.

vii. Defensive proteins: Useful for the protection of body. e.g. Immunoglobin, thrombin for clotting of blood. .

Q.20What are lipids? Explain their general properties and composition.

Ans: Lipids:

- i. They are macro-biomolecules.
- ii. Lipids are a group of heterogeneous compounds like fats, oils, steroids, waxes, etc.

Properties:

- i. Animal fat is often solid while in plants, liquid oils are present.
- ii. Lipids are insoluble in water.
- iii. They are soluble in organic or non-polar solvents like benzene, chloroform, etc.

Composition:

- i. Lipids are composed of C, H, O atoms.
- ii. The proportion of H : O is greater than 2 : 1.
- iii. Compound lipids contain N, S and P in addition to C, H and O.
- iv. Lipids possess two types of monomers such as fatty acids and long chain alcohols, commonly glycerol.

Q.22.Why plant fats are liquid at room temperature while animal fats are solid?

- Ans: i. Plant fats are unsaturated fatty acids, whereas animal fats are saturated fatty acids ...
 - ii. Fats having unsaturated fatty acids are liquid at room temperature.
 - iii. Saturated fatty acids are solid at room temperature.
 - iv. Hence, plant fats are liquid at room temperature, while animal fats are solid.

Q.23. Describe different types of lipids. Add a note on their role or functions. Ans: Lipids are classified into three main types:

- i. Simple lipids ii. Compound lipids iii. Derived lipids
- i. Simple lipids:

These are esters of fatty acids with alcohol. Fatty acid is a long straight chain of carbon atoms with a carboxyl group (–COOH) at one end. Monoglycerides have one molecule of fatty acid, diglycerides

have two apd triglycerides have three molecules of fatty acids. The fatty acids are of two types:

a. Saturated fatty acid:

These fatty acids do not have double bond between carbon atoms of its chain and consists of maximum possible hydrogen atoms. e.g. Stearic acid, palplitic acid, etc.

b. Unsaturated fatty acid:

These fatty acids contain one or more double bonds in between carbon atoms of its chain. e.g. Oleic acid. These acids are not fully saturated with hydrogen atoms. Fats containing unsaturated fatty acids are liquids at room temperature and are called oils.

ii. Compound lipids:

These lipids contain some additional element or groups in addition to fatty acids and alcohol such as nitrogen, phosphorus, sulphur, protein e.e.g. Phospholipids, glycolipids.

iii. Derived lipids:

These are the hydrolytic products of lipids. Lipids include steroids, waxes, carotenoids, essential oils, etc.

a, Steroids:

Each molecule of teroid has carbon atom arranged in four interlocking rings. Cholesterol, bile salts, male and tenale sex hormones are some of the biologically important steroids.

b. Waxes:

Plant waxes are esters of saturated fatty acids with long chain alcohols (other than glycerol) and ketone. These are secreted by epidermis and present on stem, fruit and leaves. In animals, features and fur are coated with wax.

. Carotenoids:

These are pigments, which are present in the thylakoids of chloroplasts and chromoplasts of almost all higher plants. e.g. Alpha and beta carotene, xanthophylls, etc.

Biological function of lipids:

- . Lipids are reserved food material providing energy to the body. Lipids give more amount of energy to the body after oxidation. One gm lipid produces 9.0 kcal of heat.
- ii. The cell membrane consists of lipids along with proteins.
- iii. Some lipids act as components of some enzyme systems.
- iv. Fats are present in subcutaneous tissue which acts as insulator for heat.
- v. Some lipids are important as vitamins.
- vi. Waxes found in animal tissues are esters of fatty acids and provides water proofing and check the rate of transpiration in plants.
- vii. Cholesteroi takes part in the synthesis of vitamin D and is precursor of many sex hormones.

Q.24. What are saturated fatty acids?

Ans: Fatty acids not having double bond between carbon atom of its chain and consist of maximum possible hydrogen atoms are called as saturated fatty acids.

Q.25. How many types of nucleic acids are present in the nucleus?

Ans: There are two types of nucleic acids present in the nucleus:

- i. DNA: Deoxyribose nucleic acid
- ii. RNA: Ribose nucleic acid

Q.26.What are nucleic acids? Give a brief account of DNA.

Ans: Nucleic acids:

Nucleic acids are macromolecules composed of many small units or monomers called nucleotides. There are two types of nucleic acids, i.e. DNA and RNA.

Brief account of DNA:

i. DNA is a genetic material of a cell. It is double stranded helix. Each strand of helix is made up of deoxyribose nucleotides.

- ii. These nucleotides are linked with each other by phosphodiester bonds.
- iii. Two strands of DNA molecule are parallel, complementary and joined by weak hydrogen bonds.
- iv. Nitrogen bases are complementary, i.e. A = T, G == C.
- v. Each nucleotide is made up of deoxyribose sugar which is a pentose sugar, phosphoric acid and nitrogenous base.
- vi. Two strands of DNA are antiparallel and complementary to each other. Adenine and thymine are paired with each other and cytosine is paired with guanine ..
- vii. Double hydrogen bond is present between adenine and thymine and triple hydrogen bond is present between cytosine and guanine.
- viii. Purine: Pyrimidine ratio is 1 : 1

Q.27. State the difference between nucleoside and nucleotide.

Ans: Nucleotide is made up of base, sugar appropriation of base and sugar.

Q.28. Who proposed the double helix structure of DNA ?

Ans: Watson and Crick proposed the double helix structure of DNA.

Q.29. Where is DNA located with eukaryotic cell? What are its functions?

Ans: Location: DNA is situated mainly in the nucleus, but also occurs in mitochondria and chloroplasts. Function: It is the genetic material and contains all the information needed for development and existence of an organism.

Q.30. Describe the tructure of RNA. Also, mention its types.

Ans: Structure:

RNA (robose Nucleic Acid) is a single stranded structure having fewer nucleotides as compared to DNA. The strands may be straight or variously folded upon itself.

It is made up of nucleotides.

Grach nucleotide consists of ribose sugar (5C), nitrogen base and phosphate.

Nitrogen bases are of two types: purine and pyrimidine. Adenine and guanine are two types of purines. Cytosine and uracil are two types of pyrimidines.

Types of RNA:

There are two main types of RNA:

- i. Genetic RNA: Present in most plant viruses and some animal viruses.
- **ii.** Non-genetic RNA: It is of three types: mRNA, rRNA and tRNA. Non-genetic RNA is responsible for protein synthesis in the cell.

Q.31.What is genetic RNA?

Ans: When RNA acts as genetic material as in plant viruses and some animal viruses, it is known as genetic RNA.

Q.32. Describe non genetic RNA types.

Ans: The non genetic RNA is present in organisms where DNA is the genetic material. The non genetic RNA is of the following types:

a. m-RNA (Messenger RNA):

- i. Messenger RNA forms 5% of the total RNA.
- ii. It is always single stranded, linear molecule.
- iii. It is produced from DNA. The process of formation of m-RNA from DNA is called transcription.
- iv. **Function:** It carries the genetic message from DNA to ribosomes, which are the sites of protein synthesis.

b. r-RNA (Ribosomal RNA):

- i. Ribosomal RNA, as the name suggests, is found associated with the ribosome.
- ii. It comprises about 80% of total cell RNA.
- iii. It is single stranded but folded upon itself in some regions. In some regions, nitrogen base pairing may be observed.
- iv. Function: It provides proper binding site for m-RNA during protein synthesis.

c. t-RNA (Transfer RNA):

- i. t-RNA is also called soluble RNA (s-RNA)
- ii. It is about 10 15% of the total cell RNA
- iii. It is the smallest RNA.
- iv. It is either hair-pin like or clover leaflike structure.
- v. A particular t-RNA carries a specific activated amino acid from cytoplasm to ribosome which is the site for protein synthesis.
- vi. Function: It helps intelorgation of polypeptide chain during the process called translation.

Q.33. Why is purine: pyrimidine ratio 1 : 1 in DNA while it is not so in RNA?

Ans: DNA is a double stranded molecule which is stabilized by the constant purine-pyrimidine ratio, whereas RNA is a single stranded molecule. Hence, the purine: pyrimidine ratio in DNA is 1: 1 and not in RNA.

Q.34. Distinguish between n - RNA and r - RNA.

Ans:

No.	m - RNA	r – RNA
i.	m – RNA is a linear molecule.	r – RNA is linear molecule but folded upon itself.
ii.	m RNA forms about 5 % of total cellular RNA.	r – RNA is 80 % of total cellular RNA.
iii.	It's formed in nucleus and moves to cytoplasm.	It is present on ribosomes in cytoplasm.

Q.35. Distinguish between DNA and RNA.

No.	DNA	RNA				
i.	It is a genetic material of majority of the	It is a genetic material of some viruses.				
	organisms.					
ii.	It is double stranded.	It is single stranded.				
iii.	Deoxyribose sugar is present.	Ribose sugar is present.				
iv.	Thymine is present as one of the pyrimidine base.	Uracil is present as one of the pyrimidine base.				
v.	Specific base pairing is observed.	Nitrogen bases do not form pair.				
vi.	Total number of purine is equal to total number of	Amount of purine and pyrimidine may or may not				
	pyrimidine. Thus, purine to pyrimidine ratio is 1:1.	be equal.				
vii.	It is present in nucleus.	It is present in nucleus and cytoplasm.				
viii.	It is responsible for determining hereditary	It takes part in protein synthesis.				
	characters and for formation of RNA.					

3.2 : Enzymes :

Q.36. Who coined the term enzyme?

Ans: The term 'enzyme' was coined by William Kuhne (1878) while working on fermentation. [Greek: En - in; zyma - yeast]

Q.37. What are endoenzymes?

Ans: Endoenzymes: The enzymes that are produced within a cell for metabolic activities are known as endoenzymes

Q.38. What are exoenzymes?

Ans: Exoenzymes: The enzymes which act away from the site of synthesis are called exo-enzymes. These are also known as extracellular enzymes.

Q.39. Discuss the mechanism of enzyme-action.

- **Ans:** i. It is explained by lock and key theory.
 - ii. According to this postulate, lock is the enzyme and key is the substrate. Only key with correctly positioned structure fits into key hole (i.e. active site) of enzyme.
 - iii. As specific key fits into specific lock, in the similar way specific enzyme reacts with specific substrate molecule.

- iv. The substrate (S) biporto the active site of the enzyme (E) and ES complex is formed.
- v. This induces the enzyme to alter its shape, fitting more tightly around S.

vi.	Active site breaks the	chemical	bonds of S	and new I	EP (product)	com	plex is formed	
	E +	\Rightarrow	ES	\Rightarrow	Enzyme	+	Products	
	Enzyme Substrate]	Enzyme Suł	ostrate				
		(Complex					
••		1.0	 1		.1 1	1	C C	

vii. Enzyme releases the P and free E is ready to bind another molecule of S to repeat the cycle. (It is assumed that the substrate plays a role in determining the final shape of the enzyme. It induces E to alter its shape.

Q.49. What are different classes of enzymes?

OR

Give a classification of enzymes with examples.

Ans: Enzymes are classified into six classes:

Oxidoreductase	Oxidase and dehydrogenase are the enzymes that bring about oxidation. reduction
T C	reaction. e.g, NAD oxidoreductase.
Transferases	They transfer functional group such as amino, methyl, phosphate from one substance
	to the other.e.g. Hexokinase, transaminase.
Hydrolases	They bring about hydrolysis of ester, ether, peptide bond, glycosidic bonds, C-C bonds
	e.g. alkaline phosphatase
Lyases	They catalyze removal of a group from their substrate without hydrolysis. e.g.
	Fumarase and aldolase
Isomerases	Causes catalytic interconversions of geometric, optical and positional isomers. e.g.
	Phospho hexose isomerase, triose-phospho-isomerase.
Ligases	Helps in joining the two molecules. e.g. acetyl CoA carboxylase, succinic thiokinase are examples of ligases.

Q.41. What are enzymes? State the general properties of enzymes.

Ans: Enzymes: An enzyme is a specialized proteinaceous substance produced within an organism which 'is capable of catalyzing a specific chemical reaction within the cell.

It alters the chemical reaction without undergoing any change itself.

It is also called as biocatalyst.

Properties of enzymes:

i. Role in biochemical reaction:

Enzymes accelerate the reaction, but do not initiate it.

ii. Participation in the reaction:

Enzymes do not participate in the reaction but they remain unchanged at the end of the reaction. Enzymes are therefore required in small amounts. They speed up the reaction.

iii. Active site of enzyme:

The molecule of an enzyme is larger than that of substrate molecule and hence during a reaction a specific part of enzyme molecule comes in contact with the substrate molecule. That part is called active site of an enzyme.

iv. Amphoteric nature:

Chemically, most of the enzymes are proteins and therefore show amphoteric nature. Enzymes can react with acidic substances as well as alkaline substances.

v. Specificity:

Most of the enzymes are specific in their action. A single enzyme acts upon a single substrate or a group of closely related substrates.

Example:

- a. Enzyme urease can and only upon urea and no other molecule.
- b. Enzyme invertage can act upon sucrose only.

A slight change in the configuration of the substrate molecule requires action by a different enzyme.

vi. Colloidal-nature:

All enzymes are colloidal in nature and thus provide large surface area for reaction to take place. Colloids (colloids-gel like) are mixtures of two components, i.e. dispersed particles and dispersion medium.

The size of the dispersed particles is larger than the dispersion medium.

vi. Enzyme optima:

Enzyme works best under certain defined conditions referred as optima. It includes temperature and pH.

Q.42. Describe the factors affecting enzyme activity.

OR

Write a note on factors affecting enzyme activity.

Ans: Factors affecting the activity of enzymes:

i. Temperature:

Enzyme action is greatly affected by temperature.

Enzyme activity increases with increase in temperature upto 40°C. Above 60°C, there is loss of enzyme activity because proteins get denatured.

When the temperature is reduced to .freezing point or below freezing point, the enzymes become inactivated but not destroyed. At optimum temperature, rate of reaction is more.

- **ii. pH** : For most enzymes, the effective pH is 4 to 9. Strong acid or strong base destroys the enzyme.
- **iii. Concentration of enzyme and substrate:** Rate of reaction is directly proportional to concentration of reacting molecules. With the increased concentration of substrate molecules, rate of enzyme reaction also increases upto a certain limit. Beyond a certain point, however, the enzyme becomes saturated with substrate molecules.
- **iv. Inhibitors:** Certain compounds combine with an enzyme but do not serve as substrate. They block the action of enzymes and function as inhibitors. The inhibitors usually closely resemble the substrate in structure. They are called competitive inhibitors. Poison like cyanide does not bind the enzyme at substrate binding site but binds at some other site and inhibits the activity of enzyme. Such substances are called non-competitive inhibitors.

Additional Information :

Isoenzymes or isozymes:

Multiple forms of enzymes with different molecular weight but with same catalytic activity, for example, lactate dehydrogenase has five different forms but all the five forms have same function, i.e. it catalyzes the interconversion of pyruvate and lactate.

Q.43. What is the active site of an enzyme?

Ans: Active site of an enzyme is a specific part of an enzyme which comes in contact with the substrate during reaction.

Q.44. Write a note on enzyme inhibitors.

Ans: Enzyme inhibitors are certain chemicals which inhibit enzyme activity.

During the reaction, the active site of enzyme is occupied by these substances instead of substrate molecules and the activity of the enzyme is lost.

There are two basic types of enzyme inhibitors:

- Competitive inhibitors: Competitive inhibitors are substances which are similar to substrate molecules i. in their structure.
- Non-competitive inhibitors: Non-competitive inhibitors do not bind with enzyme at substrate ii. binding site, but bind at some other site (prosthetic group) and inhibit the activity of the enzyme. e.g. Cyanide.

Q.45. What is appendyme?

Ans: Proteinaceous part of enzyme is called apoenzyme.

Q.46. Define co-factors. Explain it with examples.

Ans: i. Non-protein constituents which make an enzyme catalytically active are called as co-factors.

- Prosthetic groups are the cofactors tightly bound to an apoenzyme.
- 31 Vitamins are essential chemical components of many coenzymes.
- iv. Metal ions are required for activation of certain enzymes.

Q.47. Write the full form of NADP.

Ans: NADP: Nicotinamide adenine dinucleotide phosphate.

3.3 : Concept of Metabolism :

Q.48. Explain the term metabolism.

- It is the sum of all processes that take place in each living cell to meet day to day needs. Ans: i.
 - It consists of two kinds of reactions-catabolic process and anabolic process. ii.
 - iii. Among these processes, synthetic processes are called anabolic reactions. e.g. production of enzymes.
 - Degrading processes of cell are called catabolic reactions. e.g. glycolysis. iv.
 - Anabolic processes consume the energy, while catabolic processes release energy. V.

O.49. Name the two different kinds of metabolism.

Ans: Anabolism and catabolism are two different kinds of metabolism.

Additional Theory Questions :

- Q.1. Write a note on simple lipids and derived lipids. Refer Q.23. (i) and (iii)
- Q.2. What are the biological functions of lipids? Refer Q.23.
- Q.3. Write a short note on m-RNA. Refer Q.32. (a)
- Q.4. Describe the important properties of enzymes. Refer Q.41.
- Q.5. What are non-competitive inhibitors? Refer Q.44. (U)

Quick Review :

i.	Bloor	Coined the term 'lipid'	1943		
ii.	Emil Fischer	Called amino acids as building blocks of the proteins.	-		
iii.	Berzelius	Introduced the term protein.	1830		
iv.	F. Sanger Established the sequence of amino acids of insulin which contains 51 amino acids				
v.	Fredrick Miescher	Gave the name nuclein to nucleic acid isolated from pus cells.	1869		
vi.	Richard Altmann	First to use the term 'nucleic acid.'	1899

 Multipal Choice Question's Most common constituents of organic compounds found in organisms are a) C, H, O, P b) C, H, O, N, P Carbohydrates are composed of a) carbon b) hydrogen c) oxygen d) all of these In which of the following, the ratio of hydrogen and oxygen atoms is 2 : I? a) proteins b) fats c) oil d) carbohydrate a) carbony do not give bradler sugar units on hydrolysis? a) Monosaccharides b) Disaccharides c) Polysaccharides d) Glycogen The simplest protosaccharide b) disaccharide c) polysaccharide b) disaccharide c) polysaccharide b) disaccharide c) polysaccharide b) fixences c) erythrose d) both a) and b) If a compound contains 2 monosaccharides, d) ervide bonds a) doth a) and b) If a compound contains 2 monosaccharides, d) ervide bonds d) ester bonds A disaccharide that gives two molecules of glucose on hydrolysis is a) appetide bonds d) ester bonds A disaccharide that gives two molecules of glucose on hydrolysis is a) acrose b) maltose c) plotose sugar In a disaccharide that gives two molecules of glucose on hydrolysis is a) acrose b) maltose c) lactose d) none of these 	51
 Most common constituents of organic compounds found in organisms are a) C, H, O, P b) C, H, O c) C, H, N, P d) C, H, O, N, P Carbohydrates are composed of a) carbon b) hydrogen c) oxygen d) all of these The which of the following, the ratio of hydrogen and oxygen atoms is 2 : 1? a) proteins b) fats c) oil d) carbohydrate Which of the following do not give stratler sugar units on hydrolysis? a) Monosaccharides b) Disaccharides c) Polysaccharides c) Polysaccharides d) Glycogen The simplest protosaccharide a) drived monosaccharide b) disaccharide c) glycosidic bonds c) erythrose d) both a) and b) If a compound contains 2 monosaccharides b) disaccharide d) pertise bonds fla compound contains 2 monosaccharides c) erythrose d) both a) and b) If a carbonse sugar In a disaccharide oher through a) peptide bonds b) hydrogen bonds c) glycosidic bonds fla compound contains 2 monosaccharides d) entoses sugar ln a disaccharide oher through a) peptide bonds b) hydrogen bonds c) glycosidic bonds A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) matorse c) lactose c) many monosaccharide b) matorse c) many monosaccharide c) polysaccharides d) entore sugar 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) matorse c) lactose c) many monosaccharides c) atorse d) porteins c) atorse d) porteins c) atorse <	
 found in organisms are a) C. H. O. P. b) C. H. O. N. P. C. Carbohydrates are composed of a) carbon b) hydrogen c) oxygen d) all of these 3. In which of the following, the ratio of hydrogen c) oil d) earbohydrates a) proteins b) fats c) oil d) earbohydrates d) Mich of the following do not give couller sugar units on hydrolysis? a) Monosaccharides b) Disaccharides c) Polysical distication c) Polysical distication c) Polysical distication d) Glucose c) Proteins are formed by the condensat a) nucleic acids b) antiro acids c) fatty acids c) fatty acids d) carbohydrate d) Glycogen 5. The simplest protosaccharide made up of three carbons ameter the following is a) erythose b) glucose c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharides d) drived monosaccharide d) fats acids with glycerol 20. Keratin is a protein. a) transport b) protective c) polysaccharide d) protes sugar 9. In a disaccharide, monomers are linked with each other through a) eptide bonds c) glycosidic bonds d) hydrogen bonds c) glycosidic bonds d) hydrogen bonds c) glycosidic bonds d) hydrogen bonds c) glycosidic bonds d) more of these b) maltose c) elacto	
 a) C, H, O, P b) C, H, O, N, P c) Carbohydrates are composed of a) Chief b) Glucose c) C, H, N, P d) Chief d) Chief	
 c) C, H, N, P d) Carbohydrates are composed of a) carbon b) hydrogen c) oxygen d) all of these 3. In which of the following, the ratio of hydrogen a) proteins b) fats c) oil d) carbohydrates 4. Which of the following do not give variater sugar units on hydrolysis? a) Monosaccharides b) Disaccharides c) Polysaccharides c) Polysaccharides c) Polysaccharides c) Polysaccharide d) Glycogen 5. The simplest protosaccharide made up of three carbons amease the following is a) erythose b) Disaccharide c) glycenadehyde d) Glycogen 6. Do Orthose sugar is an example of a) derived monosaccharide b) disaccharide c) erythrose d) both a) and b) 7. Common example/s of hexose sugar is/are a) derived monosaccharide b) disaccharide c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide c) polysaccharide c) polysaccharide d) porteins 9. In a disaccharide made up of three c) elytose d) fructose c) polysaccharide d) both a) and b) 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) glycosidic bonds d) entose sugar 9. In a disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose<	in nature is
 Carbohydrates are composed of Carbohydrates are composed of Carbohydrates are composed of	
 a) carbon b) hydrogen c) oxygen d) all of these a) mino acids b) fats and oxygen atoms is 2 : 1? a) proteins b) fats c) oil d) carbohydrates 4. Which of the following do not give protein sure interse diverse di	2
 c) oxygen d) all of these b) and othese c) oxygen d) all of these c) oxygen d) all of these d) annoacids c) altose d) fats c) altose d) all of these d) fats a) proteins b) fats a) mucleic acids d) annoacids d) carbohydrate d) annoacids d) annoacids b) acconclaride c) polysaccharide d) both a) and b) ff a compound contains 2 monosaccharides d) pertose sugar e) lotsecharide d) pertose sugar fa compound contains 2 monosaccharides d) pertose sugar fa a disaccharide d) pertose sugar fa disaccharide d) pertose sugar fa disaccharide d) pertose sugar fa disaccharide c) glycosidic bonds d) ester bonds faty acids d) ester bonds faty acids d) storage faty acids d) anno acids b) proteins c) elective distribution allose c) lactose b) maltose c) lactose d) none of these 	
 3. In which of the following, the ratio of hydrogen and oxygen atoms is 2 : 1? a) proteins b) fats c) oil d) carbohydrates 4. Which of the following do not give tradier sugar units on hydrolysis? a) Monosaccharides b) Disaccharides c) Polysaccharides c) Polysaccharides d) Glycogen 5. The simplest poi osaccharide made up of three carbons among the following is a) erythose b) glucose c) glycereldehyde d) ribose 6. Decornibose sugar is an example of a monosaccharide b) disaccharide c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharide, b) disaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) pertide bonds b) lydrogen bonds c) glycosidic bonds b) hydrogen bonds c) glycosidic bonds b) disaccharide that gives two molecules of glucose c) glycosidic bonds b) hydrogen bonds c) glycosidic bonds d) entores exigar 20. Keratin is a protein. a) transport b) protective c) structural d) storage 21. Fatty acids which do not contain do between carbon atoms are of a) saturated fatty acids c) olici and linolenic acids d) linoleic and linolenic acids d) linoleic and linolenic acids d) linoleic acids d) linoleic acids 	
 and oxygen atoms is 2 : 1? a) proteins b) fats c) oil d) carbohydrate 4. Which of the following do not give tradier sugar units on hydrolysis? a) Monosaccharides b) Disaccharides c) Polysaccharides c) Polysaccharides c) Polysaccharides c) glycerddehyde d) ribose 5. The simplest polyoaccharide made up of three carbons amenes the following is a) erythose b) glucose c) glycerddehyde d) biaccharide c) polysaccharide d) both a) and b) 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) both a) and b) 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) exter bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) mattose c) lactose d) none of these 	
 a) proteins b) fats c) oil d) carbohydrates 4. Which of the following do not give statuler sugar units on hydrolysis? a) Monosaccharides b) Disaccharides c) Polysaccharides d) Glycogen 5. The simplest protosaccharide made up of three carbons amore true following is a) erythyse b) glucose c) glycarddehyde d) fibose 6. De orribose sugar is an example of the following is an example of the fol	
 c) oil d) carbohydrata a) Monosaccharides c) Polysaccharides d) Glycogen 5. The simplest protosaccharide made up of three carbons amongor the following is a) erythyse b) glucose c) glycarddehyde d) ribose 6. Di oy tribose sugar is an example of c) polysaccharide d) simple protein 7. Common example/s of hexose sugar is/are a) glucose b) fructose c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharide b) disaccharide c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 11. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 12. Cell membranes are made up of a) piptide bonds b) lipids 	
 4. Which of the following do not give smaller sugar units on hydrolysis? a) Monosaccharides b) Disaccharides c) Polysaccharides d) Glycogen 5. The simplest procesaccharide made up of three carbons amene of the following is a) eryth se b) glucose c) glycarddehyde d) ribose 6. Do orthose sugar is an example of atomonosaccharide b) disaccharide c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharide b) disaccharide c) polysaccharide d) derived monosaccharide b) disaccharide c) polysaccharide d) both a) and b) 8. If a compound contains 2 monosaccharides b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 10. The simple that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 10. The simple that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 10. The simple that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 10. The simple that gives two molecules of glucose on hydrolysis is a) sucrose b) molecule that gives two molecules of glucose on hydrolysis is a) sucrose b) molecule that gives two molecules of glucose on hydrolysis is a) suc	
 units on hydrolysis? a) Monosaccharides b) Disaccharides c) Polysaccharides d) Glycogen 5. The simplest portosaccharide made up of three carbons among the following is a) erythose b) glucose c) glycaraldehyde d) ribose 6. Protein is a) micromolecule b) macromolecule c) soluble d) specific 7. The simplest portosaccharide b) disaccharide c) polysaccharide d) simple protein 7. Common example/s of hexose sugar is an example of a) fluctose c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharide, b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 16. Protein is a) micromolecule b) maltose c) actose d) none of these 16. Protein is a) micromolecule c) soluble d) specific 17. Which of the following is the milk prodise i	
 a) Monosaccharides b) Disaccharides c) Polysaccharides d) Glycogen 5. The simplest porosaccharide made up of three carbons amore withe following is a) erythrose b) glucose c) glycaraldehyde d) ribose 6. Do orribose sugar is an example of atomonosaccharide b) disaccharide c) polysaccharide d) simple protein 7. Common example/s of hexose sugar is/are a) glucose b) fructose c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharide, b) disaccharide c) polysaccharide d) derived monosaccharide b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 	drates
 b) Disaccharides c) Polysaccharides d) Glycogen 5. The simplest porosaccharide made up of three carbons amore of the following is a) erythose b) glucose c) glycaddehyde d) ribose 6. Deo orbose sugar is an example of atomonosaccharide b) disaccharide c) polysaccharide d) simple protein 7. Common example/s of hexose sugar is/are a) glucose b) fructose c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 	
 c) Polysaccharides d) Glycogen 5. The simplest protosaccharide made up of three carbons ameneor the following is a) erythose b) glucose c) glycaeldehyde d) ribose 6. Deo ortibose sugar is an example of a chononosaccharide b) disaccharide c) polysaccharide d) simple protein 7. Common example/s of hexose sugar is/are a) glucose b) fructose c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose b) maltose c) lactose d) none of these 	
 d) Glycogen d) Fat compound contains 2 monosaccharide d) pentose sugar e) polysaccharide d) simple protein fa compound contains 2 monosaccharide b) disaccharide c) erythrose d) both a) and b) ff a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) both a) and b) ff a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) pentose sugar fn a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) pentose sugar fat acompound contains 2 monosaccharide b) disaccharide c) polysaccharide d) pentose sugar fat acompound contains 2 monosaccharide b) disaccharide c) polysaccharide d) pentose sugar fat acompound set ponds c) glycosidic bonds d) ester bonds fat cose d) none of these b) maltose c) lactose d) none of these 	
 5. The simplest processaccharide made up of three carbons amone or the following is a) eryth vse b) glucose c) glyceraldehyde d) ribose 6. Dro yribose sugar is an example of a) nonosaccharide b) disaccharide c) polysaccharide d) simple protein 7. Common example/s of hexose sugar is/are a) glucose b) fructose c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) peptide bonds d) peptide bonds d) pettide bonds d) seter bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 	
 carbons amone at the following is a) erythose b) glucose c) glyceraldehyde d) ribose 6. Dro yribose sugar is an example of a) monosaccharide b) disaccharide c) polysaccharide d) simple protein 7. Common example/s of hexose sugar is/are a) glucose b) fructose c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these a) sucrose b) maltose c) lactose d) none of these 	
 a) erythose b) glucose c) glycaraldehyde d) ribose 6. Deo yribose sugar is an example of a) monosaccharide b) disaccharide c) polysaccharide d) simple protein 7. Common example/s of hexose sugar is/are a) glucose b) fructose c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) entose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 	protein?
 c) glycarddehyde d) ribose 6. Deo oribose sugar is an example of a monosaccharide b) disaccharide c) polysaccharide d) simple protein 7. Common example/s of hexose sugar is/are a) glucose b) fructose c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds c) glycosidic bonds d) ester bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 18. Which of the following releases lot of its breakdown? a) Carbohydrate b) Fat c) Starch d) Protein 19. Simple lipids are esters of a) amino acids b) proteins c) phosphorus d) fatty acids with glycerol 20. Keratin is a protein. a) transport b) protective c) structural d) storage 21. Fatty acids which do not contain do between carbon atoms are a) saturated fatty acids c) oleic and linoleic acids d) linoleic and linolenic acids 	
 6. Decorribose sugar is an example of a monosaccharide b) disaccharide c) polysaccharide d) simple protein 7. Common example/s of hexose sugar is/are a) glucose b) fructose c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 11. Wither of the original distribution or or distribution or distribution or distribution or distribution or distrebuti	
 a) nonosaccharide b) disaccharide c) polysaccharide d) simple protein 7. Common example/s of hexose sugar is/are a) glucose b) fructose c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 	t of energy on
 c) polysaccharide d) simple protein 7. Common example/s of hexose sugar is/are a) glucose b) fructose c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds fatty acids which do not contain do between carbon atoms are a) sucrose b) maltose c) lactose d) none of these a) sucrose b) maltose c) lactose d) none of these 	
 7. Common example/s of hexose sugar is/are a) glucose b) fructose c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 19. Simple lipids are esters of a) amino acids b) proteins c) phosphorus d) fatty acids with glycerol 20. Keratin is a protein. a) transport b) protective c) structural d) storage 21. Fatty acids which do not contain do between carbon atoms are a) saturated fatty acids b) unsaturated fatty acids c) oleic and linoleic acids d) linoleic and linolenic acids 	
 a) glucose b) fructose c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds d) ester bonds d) ester bonds d) linoleic and linolenic acids 	
 c) erythrose d) both a) and b) 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) both a) and b) b) both a) and b) b) proteins c) phosphorus d) fatty acids with glycerol 20. Keratin is a protein. a) transport b) protective c) structural d) storage 21. Fatty acids which do not contain do between carbon atoms are a) saturated fatty acids b) unsaturated fatty acids c) oleic and linoleic acids d) linoleic and linolenic acids 	
 8. If a compound contains 2 monosaccharides, then it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 16. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 17. Fatty acids which do not contain do between carbon atoms are a) sturated fatty acids b) unsaturated fatty acids c) oleic and linolenic acids 	
 it is described as a) derived monosaccharide b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these (c) phospholus (c) fatty acids with glycerol 20. Keratin is a protein. a) transport b) protective c) structural d) storage 21. Fatty acids which do not contain do between carbon atoms are a) saturated fatty acids b) unsaturated fatty acids c) oleic and linolenic acids d) linoleic and linolenic acids 22. Cell membranes are made up of a) proteins b) lipids 	
 a) derived monosaccharide b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds fatty acids which do not contain do between carbon atoms are a) sucrose b) maltose c) lactose d) none of these 	
 b) disaccharide c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds f) b) hydrogen bonds c) glycosidic bonds d) ester bonds f) a disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 	
 c) polysaccharide d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these a) hydrogen bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds d) ester bonds e) maltose b) maltose c) lactose d) none of these 	19
 d) pentose sugar 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) pentose sugar 21. Fatty acids which do not contain do between carbon atoms are a) saturated fatty acids b) unsaturated fatty acids c) oleic and linoleic acids d) linoleic and linolenic acids 22. Cell membranes are made up of a) proteins b) lipids 	C
 9. In a disaccharide, monomers are linked with each other through a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 21. Tutty deds which do not contain de between carbon atoms are a) saturated fatty acids b) unsaturated fatty acids c) oleic and linoleic acids d) linoleic and linolenic acids 22. Cell membranes are made up of a) proteins b) lipids 	double bond
other througha) saturated fatty acidsa) peptide bondsb) hydrogen bondsb) unsaturated fatty acidsc) glycosidic bondsd) ester bondsb) unsaturated fatty acidsc) glycosidic bondsd) ester bondsc) oleic and linoleic acids10.A disaccharide that gives two molecules of glucose on hydrolysis isd) linoleic and linolenic acidsa) sucroseb) maltosec) lactosed) none of theseb) lipids	double bolid
 a) peptide bonds b) hydrogen bonds c) glycosidic bonds d) ester bonds d) ester bonds d) ester bonds d) ester bonds c) oleic and linoleic acids d) linoleic and linolenic acids d) linoleic and linolenic acids 22. Cell membranes are made up of a) sucrose b) maltose c) lactose d) none of these b) suthated futly defest b) unsaturated fatty acids c) oleic and linolenic acids d) linoleic and linolenic acids b) maltose b) maltose b) maltose c) lactose 	
 c) glycosidic bonds d) ester bonds c) oleic and linoleic acids d) linoleic and linoleic acids b) maltose c) lactose d) none of these b) lipids 	
 10. A disaccharide that gives two molecules of glucose on hydrolysis is a) sucrose b) maltose c) lactose d) none of these 10. A disaccharide that gives two molecules of d) linoleic and linolenic acids 21. Cell membranes are made up of a) proteins b) lipids 	
glucose on hydrolysis is22. Cell membranes are made up ofa) sucroseb) maltosec) lactosed) none of theseb) lipids	
a) sucroseb) maltosea) proteinsc) lactosed) none of theseb) lipids	
c) lactose d) none of these b) lipids	
0/11/100	
11. Sugar present in milk is c) lipids and proteins	
a) fructose b) lactose d) carbohydrates	
c) galactose d) sucrose 23. A nucleotide contains	
12. Polysaccharides consist of23. A indeconde containsa) sugar + phosphate	
a) two monosaccharide units b) N-base + phosphate	

		Biochemis	stry of	Cell	52
	c) sugar + nitrogenou	is base		a) Lyases	b) Ligases
	d) sugar + N-base +	phosphate		c) Hydrolases	d) Transferases
24.	Nucleotides, the poly	ymers of nucleic acid ,are	35.	catalyze inte	rconversions of geometrie
	joined together by			optical and positional	isomers.
	a) Peptide bond			a) Transferases	b) Ligases
	b) Ester bond			c) Oxidoreductase	d) Isomerases
	c) Phosphodiester bo	nd	36.		wn as dehydrogenases.
	d) Glycosidic bond			a) Oxidoreductases	
25.	Find the odd one.		2	c) Lyases	d) Transferases
	a) Adenine	b) Cytosine d) Uracil ency of cell is a	37.	The enzyme function	is best at temperature
	c) Thymine	d) Uracil		a) 30° to 50° C	b) 15° to 25° C
26.	ATP, the energy curre	ency of cell is a		c) 20° to 30° C	d) 40° to 50° C
	a) Protein	b) Nucleotide	38.		ges from 30° to 45° C, th
	c) Nucleoside	d) Coenzyme		rate of enzyme activity	ty will
27.	The two strands of D			a) decrease	
	a) similar in nature ar	nd complementary		b) increase	
	b) anti-parallel and co			c) first increase and	then decrease
	c) parallel and compl			d) first decrease and	then increase
	d) basically different	in nature	39.	Out of the following.	, which is not a property of
28.	RNA is genetic mate			enzymes?	
	a) bacteria	b) cyanobacteria		a) Specific in nature	
	c) bacteriophages	d) plant viruses		b) Proteinaceous	
29.		ent in more amount in the		c) Used up in reactio	n
	cell			d) Increased rate of b	biochemical reaction
	a) m-RNA	b) t-RNA	40.	At high temperature,	enzyme gets
C	c) r-RNA	d) not certain		a) denatured	b) killed
30.	Smallest RNA is			c) slightly activated	d) inactivated
	a) t-RNA	b) m-RNA	41.	Majority of cellular	enzymes function best
	c) r-RNA	d) not specific		pH.	
31.	Hair pin like structure	e is observed in		a) acidic	b) basic
	a) m-RNA	b) t-RNA		c) neutral	d) strang base
	c) r-RNA	d) DNA	42.	The action of enzyme	with a substrate is explaine
32.	All enzymes are			by lock and key theory	ry.
	a) proteins	b) lipids		a) relative	b) specific
	c) carbohydrates	d) vitamins		c) random	d) abstract
33.	Find out the incorrec	t one.	43.	was the firs	t to isolate urease in put
	a) All enzymes are sp				n the Jack bean extract.
	b) All enzymes are bi			a) W. Kuhne	b) G. Mendel
	c) All enzymes are pr	2		c) J. B. Sumner	d) both a) and c)
	d) All proteins are en			, 	
34.	· •	drolysis of ester, ether etc.		20	06
