The following question given below consist of an "Assertion" (A) and "Reason" (R) Type questions. Use the following Key to choose the appropriate answer.
(A) If both (A) and (R) are true, and ( $R$ ) is the correct explanation of $(A)$.
(B) If both (A) and (R) are true but ( R ) is not the correct explanation of $(A)$.
(C) If (A) is true but ( $R$ ) is false.
(D) If (A) is false but $(R)$ is true.
Q. 1 Assertion : When a force of 20 N displaces a body by 5 m then work done by this force must be 100 J for every observer watching that body.
Reason : Work done on a body depends on the observer that is observing the body.
[D]
Q. 2 Assertion : The work-energy theorem is independent of Newton's second law.
Reason : According work energy theorem net work done on a body is equal to change in its kinetic energy.
Q. 3 Assertion : The work done in bringing a body down from the top to the base along a frictionless incline plane is the same as the work done in bringing it down from the vertical side. Reason : The gravitational force on the body along the inclined plane is the same as that along the vertical side.
[B]
Q. 4 Assertion When a spring is elongated work done by spring is negative but when it compressed work done by spring is positive.
Reason : Work done by spring is path independent.
[D]
Q. 5

Assertion : When a force of 20 N displaces a body by 5 m then for every observer watching that body work done on the body is 100 J .

Reason : Work done on a body by a force depends on the observer that is watching the body.
[D]
Q. 6 Assertion : When the force of 100 N displaces a body by 5 m the work done by this force is 500 J for every observer watching that body.
Reason : Work done by a force depends on the observer that watching the body.
[D]
Q. 7 Assertion : Work done by or against force of friction in moving a body through any round trip is zero.
Reason : This is because friction is a conservative force.
Q. 8 Assertion Work done in moving a body over a smooth inclined plane does not depend upon slope of inclined plane, provided its height is same.

Reason : $\mathrm{W}=\mathrm{mgh}=\mathrm{mg} \ell \sin \theta$
Q. 9 Assertion : For stable equilibrium Force has to be zero and potential energy should be minimum.

Reason : For equilibrium, it is not necessary that the force is not zero.
Q. 10 Assertion : Mass and energy are not conserved separately, but are conserved as a single entity called 'mass-energy'.

Reason : This is because one can be obtained at the cost of the other as per Einstein equation.
[A]
Q. 11 Assertion : For the graph (given) force (F) versus distance ( $x$ ) the graph of kinetic energy versus distance is a hyperbola :

Reason : Force is equal to kinetic energy gradient $\mathrm{F}=\frac{\mathrm{dk}}{\mathrm{dx}}$.
Q. 12 Assertion : The work done by all forces on a system equals to the change in kinetic energy of that system. This statement is true even if nonconservative forces act on the system.
Reason : The total work done by internal forces may be positive.
[B]
Sol. Both (A) \& (R) are true. The work done by all forces on a system is equal to change in its kinetic energy, irrespective of fact whether work done by internal forces is positive, is zero or is negative.
Q. 13 Statement I : Work done by or against the friction in moving the body through any round trip is zero.
Statement II : This is because friction is a conservative force.
[D]
Q. 14 Statement I : Work done in moving a body over a smooth inclined plane does not depend upon slope of inclined plane, provided its height is same.
Statement II : W $=\mathrm{mgh}=\mathrm{mglsin} \theta \quad$ [A]
Q. 15 Assertion : A bus and a car having same K.E. are brought to rest by application of brake. Assume that by application brake rotational motion of wheel ceases and wheels start slidding. If co-efficient of friction is same between road and wheels of bus as well as car, both will stop in same distance.
Reason : Retardation of bus and car will be same.
Sol. [D]
(A) is false but (R) is true.

Retardation of both (car and bus) $=\mu \mathrm{g}$
Distance travelled by vehicle $=\frac{\mathrm{v}^{2}}{\mu \mathrm{~g}}=\frac{2 \mathrm{~K}}{\mathrm{~m} \mu \mathrm{~g}}$
K. K.E. of vehicles
m : Mass of vehicles
Q. 16 Statement I: Work done by or against gravitational force in moving a body from one point to another is independent of the actual path followed between the two points.
Statement II: Gravitational forces are conservative forces.

[^0]Sol. Work done by or against conservation force does not depend on path.
Q. 17 Assertion : When a spring is elongated work done by spring is negative but when it compressed work done by spring is positive.
Reason : Work done by spring is path independent.

Q. 10 Kinetic energy of a particle is continuously increasing with time. It means-
(A)resultant force always acts along the direction of motion
(B)its height above the ground level may be decreasing
(C) resultant force is at an angle less than $90^{\circ}$ to the direction of motion
(D) power associated with resultant force is not equal to zero
[B,C,D]
Q. 11 The potential energy of a particle of mass 5 kg , moving in the xy plane, is given by $U=-7 x+24 y J$, where $x$ and $y$ being in metres. Initially (at $\mathrm{t}=0$ ), the particle is at the origin and has velocity $\mathrm{v}=(14.4 \hat{\mathrm{i}}+4.2 \hat{\mathrm{j}}) \mathrm{m} / \mathrm{s}$. Then-
(A) the speed of the particle at $t=4 \mathrm{~s}$, is $25 \mathrm{~m} / \mathrm{s}$
(B) the acceleration of the particle is $5 \mathrm{~m} / \mathrm{s}^{2}$
(C) the direction of acceleration of the particle is perpendicular to its direction of motion, initially
(D) the direction of acceleration of the particle is along the direction of motion, initially

Q. 13 A man pushes a block of 30 kg along a level floor at constant speed with a force directed at $45^{\circ}$ below the horizontal. If the coefficient of friction is 0.20 , then-
(A)net force on the block is zero
(B) work done by the man on the block in pushing it through 10 m is 750 J
(C) work done by the force of gravity is zero
(D)work done by all the forces exerted by the surface on the block in 20 metres is -1500 J
Q. 14 A block of mass 2 kg is hanging over a smooth and light pulley through a light string. The other end of the string is pulled by a constant force $\mathrm{F}=40 \mathrm{~N}$. The kinetic energy of the particle increases 40 J in a given interval of time. Then- $\left(\mathrm{g}=10 \mathrm{~m} / \mathrm{s}^{2}\right)$
(A) tension in the string is 40 N
(B) displacement of the block in the given interval of time is 2 m
(C) work done by gravity is -20 J
(D) work done by tension is 80 J

Q. 15 If the kinetic energy of a body is directly proportional to time $t$, the magnitude of the force acting on the body is-
(A) directly proportional to $\sqrt{ } \mathrm{t}$
(B) inversely proportional to $\sqrt{ } \mathrm{t}$
(C) directly proportional to the speed of the body
(D) inversely proportional to the speed of the body
[B,D]
Q. 16 A particle is acted upon by a force of constant magnitude which is atways perpendicular to the velocity of the particle. The motion of the particle takes place in a plane. It follows that-
[IIT-1987]
(A) Its velocity is constant
(B) Its acceleration is constant
(C) Its kinetic energy is constant
(D) It moves in a circular path
[C,D]
Q. 17 If force is always perpendicular to motion :
(A) Kinetic energy perpendicular constant
(B) Work done is zero
(C) Velocity is constant
(D) Speed is constant
[A,B,D]
Q. 18 Work done by force of friction -
(A) May be positive
(B) May be negative
(C) May be zero
(D) None of these
[A,B,C]
Q. 19 Which of the following may be negative-
(A) Kinetic energy
(B) Potential energy
(C) Mechanical energy
(D) None of these

Q. 1 A particle of mass $m$ is attached to the end of a light inextensible string of length 2 a , the other end of which is attached to a fixed point $P$. The particle is projected horizontally from the point 2a below P with speed v . As it comes in level with P , a peg distant a from P catches the string. In the subsequent motion, the particle can just describe a full circle about Q. Find v. (see figure).

Ans. $\quad \mathrm{v}=\sqrt{7 \mathrm{ag}}$
Q. 2 A particle moves along the x -axis from $\mathrm{x}=0$ to x $=5 \mathrm{~m}$ under the influence of a force $\mathrm{F}($ in N$)$ given by $F=3 x^{2}-2 x+7$. Calculate the work done by this force.
Sol. $\quad 135$ J
Q. 3 Figure shows two blocks $A$ and $B$, each having a mass of 320 g connected by a light string passing over a smooth light pulley. The horizontal surface on which the block A can slide is smooth. The block. A is attached to a spring of spring constant $40 \mathrm{~N} / \mathrm{m}$ whose other end is fixed to a support 40 cm above the horizontal surface. Initially, the spring is vertical and unstretched when the system is released to move. Find the velocity of the block A at the instant it breaks off the surface below it. Take $\mathrm{g}=10 \mathrm{~m} / \mathrm{s}^{2}$.

Ans. $\quad 1.5$ m/s
Q. 4 A body of mass $m$ is hauled from the Earth's surface by applying a force F varying with the height of ascent $y$ as $F=2\left(y_{\sigma}-1\right) \mathrm{mg}$, where a is a positive constant. Find the work performed by this force and the increment of the body's potential energy in the gravitational field of the Earth over the first half of the ascent.
Ans. $\quad A=\frac{3 m g}{4 a}, \Delta U=\frac{m g}{2 a}$
Q. 5 Asmooth sphere of radius R is made to translate in a straight line with a constant acceleration $a$. A particle kept on the top of the sphere is released from there at zero velocity with respect to the sphere. Find the speed of the particle with respect to the sphere as a function of the angle $\theta$ it slides.

Ans. $\quad[2 \mathrm{R}(\mathrm{a} \sin \theta+\mathrm{g}-\mathrm{g} \cos \theta)]^{1 / 2}$
Q. 6 A x'man stretches a spring attached to the front wall of a railway carriage through a distance $\ell$ in time $\tau$ opposite to the motion of the carriage, during which the train it self moved through L . What will be the work done by the man in a system fixed to the train and to the track.

Ans. $\quad \frac{1}{2} \mathrm{~K} \ell^{2}$, work done is same in both the frames
Q. 7 The power of an engine is frequently determined experimentally with the aid of the so-called absorption dynamometer which consists of two shoes tightly gripping the shaft of the engine. A lever with a weight on the end
W.P.E.
is attached to one of the shoes (Fig.). The weight is selected so as to equalize the force of friction and hold the lever in a horizontal position.

Determine the power of the engine if the number of shaft revolutions is $n=60 \mathrm{rpm}$, the length of the lever from the centre of the shaft is $\ell=1 \mathrm{~m}$ and the weight $\mathrm{Q}=50 \mathrm{kgf}$. Disregard the weight of the lever.
Sol. $\quad 4.2 \mathrm{hp}$
Q. 8 A body of mass $m$ is pushed with the initial velocity $v_{0}$ up an inclined plane set at an angle $\alpha$ to the horizontal. The friction coefficient is equal to k . What distance will the body cover before it stops and what work do the friction forces perform over this distance ?
Ans. $\quad v_{0}{ }^{2} / 2 \mathrm{~g}(\sin \alpha+\mathrm{k} \cos \alpha), \mathrm{A}=-\mathrm{mv}_{0}{ }^{2} \mathrm{k} / 2(\mathrm{k}+\tan \alpha)$
Q. 9 A system consists of two springs connected in series and having the stiffness, coefficient $\mathrm{k}_{1}$ and $\mathrm{k}_{2}$. Find the minimum worked to be performed in order to stretch this system by $\Delta \ell$.
Ans. $\quad A_{\text {min }}=\frac{1}{2} \mathrm{k}(\Delta \ell)^{2}$, where $\mathrm{k}=\frac{\mathrm{k}_{1} \mathrm{k} / 2}{\mathrm{k}_{1}+\mathrm{k}_{2}}$
Q. 10 A block of mass 2.0 kg is pulled up on a smooth incline of angle $30^{\circ}$ with the horizontal. If the block moves with an acceleration of $1.0 \mathrm{~m} / \mathrm{s}^{2}$, find the power delivered by the pulling force at a time 4.0 s after the motion starts. What is the average power delivered during the 4.0 s after the notion starts?
Ans. $\quad 47 \mathrm{~W}, 24 \mathrm{~W}$
Q. 11 A motorcycle whose mass including rider is 200 kg can go at $10 \mathrm{~m} / \mathrm{s}$ up a plane of inclination 1 in 14 and $20 \mathrm{~m} / \mathrm{s}$ down the same plane. If the resistance varies as the square of the speed and the power developed by the machine is constant, find the power developed.

## Ans. 2 KW

Q. 12 A block of mass $m$ is kept over another block of mass M and the system rests on a horizontal surface, (figure). A constant horizontal force F acting on the lower block produces an acceleration $\frac{F}{2(m+M)}$ in the system, the two blocks always move together.
(a) Find the coefficient of kinetie friction between the bigger block and the horizontal surface. (b) Find the frictional force acting on the smaller block. (c) Find the work done by the force of friction on the smaller block by the bigger block during a displacement $d$ of the system.

A small body of mass $m$ is located on a horizontal plane at the point O . The body acquires a horizontal velocity $\mathrm{v}_{0}$. Find:
(a) the mean power developed by the friction force during the whole time of motion, if the friction coefficient $\mathrm{k}=0.27, \mathrm{~m}=1.0 \mathrm{~kg}$, and $\mathrm{v}_{0}=1.5 \mathrm{~m} / \mathrm{s}$;
(b) the maximum instantaneous power developed by the friction force, if the friction coefficient varies as $\mathrm{k}=\alpha \mathrm{x}$, where $\alpha$ is a constant, and x is the distance from the point O .
Ans. (a) $\langle\mathrm{P}\rangle=-\operatorname{kmgv}_{0} / 2=-2 \mathrm{~W}$
(b) $\mathrm{P}_{\max }=-\frac{1}{2} \mathrm{mv}_{0}^{2} \sqrt{\alpha g}$
Q. 14 A block of mass $m$ is pushed against a spring of spring constant k fixed at one end to a wall. The block can slide on a frictionless table as shown in figure. The natural length of the spring is $L_{0}$ and it is compressed to half its natural length when the block is released. Find the velocity of the block as a function of its distance x from the wall.

Ans. $\quad v=\sqrt{\frac{k}{m}}\left[\frac{L_{0}^{2}}{4}-\left(L_{0}-x\right)^{2}\right]^{1 / 2}$, when $x \leq L_{0}$; $\mathrm{v}=\sqrt{\frac{\mathrm{k}}{\mathrm{m}}} \frac{\mathrm{L}_{0}}{2}$, when $\mathrm{x} \geq \mathrm{L}_{0}$
Q. 15 An object is attached to a vertical spring and slowly lowered to its equilibrium position. This stretches the spring by an amount d. If the same object is attached to the same vertical spring but permitted to fall instead, through what distance does it stretch the spring ?
Ans. 2d
Q. 16 One end of a light spring of natural length $d$ and spring constant K is fixed on a rigid wall and the other is fixed to a smooth ring of mass m which can slide without friction in a vertical rod fixed at a distance $d$ from the wall. Initially the spring makes an angles of 370 with the horizontal as shown in figure. When the system is released from rest, find the speed of the ring when the spring becomes horizontal.
$\left[\sin 37^{\circ}=3 / 5\right]$

Ans. $\quad v=d \sqrt{\left(\frac{3 g}{2 d}+\frac{K}{16 m}\right)}$
Q. 17 A uniform chain of length $\ell$ and mass $m$ overhangs a smooth table with its two third part lying on the table. Find the kinetic energy of the chain as it completely slips off the table.

Ans. $\quad \frac{4}{9} \mathrm{mg} \ell$
Q. 18 A body of mass $m$ was slowly hauled up the hill (fig). by a force F which at each point was directed along a tangent to the trajectory. Find the work performed by this force, if the height of the hill is h , the length of its base $\ell$, and the coefficient to friction K .

## Ans. $\quad \mathrm{A}=\mathrm{mg}(\mathrm{h}+\mathrm{k} \ell)$

Q. 19 Two cylindrical vessels of equal cross-sectional area A contain water upto heights $h_{1}$ and $h_{2}$. The vessels are interconnected so that the levels in them become equal. Calculate the work done by the force of gravity during the process. The density of water is $\rho$.
Ans. $\quad \rho A\left(\frac{h_{1}-h_{2}}{2}\right)^{2} g$
Q. 20 A body of mass $m$ is thrown at an angle $\alpha$ to the horizontal with initial velocity $v_{0}$. Find the mean power imparted by gravity over the whole time of motion of body and the instantaneous power of gravity as a function of time.
Ans. zero
